

AUTOCHEMISTRY

Quantum-Chemistry Workflows, Made Visual

A concise overview of AutoChemistry's tools for ORCA input creation, calculation setup, xTB screening, reaction-pathway management, potential-energy analysis, and live browser access.

Free and open source | Built for computational chemistry researchers | autochemistry.xyz | [GitHub](#)

The screenshot shows the AutoChemistry website homepage. At the top center is the AutoChemistry logo, which consists of a stylized 'AC' in a hexagonal shape with the text 'AUTOCHEMISTRY' and 'AUTOMATE COMPUTATIONAL CHEMISTRY' below it. Below the logo is a button that says 'Free & open-source'. Underneath that is the text 'ABOUT AUTOCHEMISTRY'. The main heading reads 'Built for researchers for computational chemistry', with 'for' in red and 'computational chemistry' in orange. Below this is a paragraph: 'AutoChemistry helps you create ORCA inputs, build PES plots, and streamline quantum-chemistry workflows in the browser—so you can save time and focus on new ideas and science.' Below the text is a section titled 'The AutoChemistry Team' which contains three circular portrait photos of the team members: a man with dark hair and a beard, a man with glasses and a striped shirt, and a man with dark hair and a suit.

Create inputs. Run and inspect calculations. Build clear mechanistic figures.

FEATURE 01

ORCA Input & HPC Script Generation

Build ORCA calculations from guided controls while AutoChemistry generates both the input file and a reusable shell script beside the molecular structure.

The screenshot displays the AutoChemistry web interface, which is organized into a sidebar on the left and a main workspace on the right. The sidebar contains navigation buttons for 'Input Creator', 'Output Viewer', 'PES Plot', 'DIA', 'Orbital Creator', 'ML', 'xtb & Conformational Analysis', and 'About us'. The main workspace is divided into several sections:

- Projects:** Includes dropdowns for 'Project' and 'Sub-project', and buttons for 'Save current...', 'Delete sub', and 'Delete project'.
- Input & Script Generator:** This section has tabs for 'Theory', 'Method & Basis', 'Parameters', 'Script', and 'xtb Pre-submit'. The 'Theory' tab is active, showing:
 - Theory Type:** A dropdown menu set to 'DFT'.
 - Spin configuration:** A dropdown menu set to 'UKS # unrestricted open-shell (UKS for DFT)' with an 'Auto-Recommend' button.
 - Job Type:** A dropdown menu set to 'Scan' with buttons for 'Edit', 'Custom Jobs...', and 'Bond Scan'.
 - Atoms:** Input fields for '70' and '71' with a 'Pick atoms...' button.
 - Start (Å/deg):** '1', **End (Å/deg):** '2', **Steps:** '10'.
 - System & Output:** 'Charge: 0', 'Multiplicity: 1', and 'Job Name: guess'.
- Geometry (XYZ format):** A text area showing the molecular structure in XYZ format, starting with '72' and 'Geometry'. Below the text area are buttons for 'Load XYZ', 'Visualize', 'Clear', 'Open External Viewer', 'Generate Preview', and 'Save Files'.
- Input (.inp) / Job Script (.sh):** A text area showing the generated ORCA input file and shell script. The input file content is:

```
!UKS BP86 def2-SVP D3BJ RI def2/J opt uno uco keepdens TightSCF

%geom Scan
B 70 71 = 1, 2, 10
end
end

%scf maxiter 1000 end

%geom maxiter 100 end
```
- Structure visualization:** A section with a dropdown for 'Visualization Software' set to 'ACV (AutoChemistryViewer)' and an 'Open' button. Below this is a 3D ball-and-stick model of a complex organic molecule.

Guided calculation setup: Configure theory, spin, job type, scan coordinates, geometry, convergence settings, and advanced ORCA keywords in one workspace.

Local or HPC: Generate ORCA .inp and shell .sh files for a workstation or adapt the script for an HPC scheduler and cluster environment.

FEATURE 02

Functional & Basis-Set Selection

Choose density functionals and basis sets from organized scientific libraries instead of manually recalling and typing every ORCA keyword.

The screenshot displays the AutoChemY web interface. On the left is a sidebar with navigation buttons: Input Creator, Output Viewer, PES Plot, DIA, Orbital Creator, ML, xtb & Conformational Analysis, and About us. The main area is titled 'Input & Script Generator' and includes tabs for Theory, Method & Basis, Parameters, Script, and xTB Pre-submit. Under 'Method & Basis', the 'Selected Theoretical Model' is set to 'BP86'. The 'Basis Details' section shows the 'Basis Set' as 'def2-SVP'. A 'Split Basis Set (By Atom/Element)' toggle is turned on, with a target of 'Co (0)' and a split assignment of 'newto def2-TZVP'. The 'Approximations' section includes a 'Dispersion Correction' slider and an 'Integration Grid' dropdown. The 'Geometry (XYZ format)' section shows a 72-atom molecule with coordinates. At the bottom are buttons for 'Load XYZ', 'Visualize', 'Clear', 'Open External Viewer', 'Generate Preview', and 'Save Files'.

Overlaid on the right is the 'Select Density Functional' dialog box. It features a 'Grouping' section with radio buttons for 'Popular / Famous' (selected), 'By Family', and 'By Developer', along with a search bar. The dialog displays a grid of functionals categorized into GGA, Hybrid & Meta GGA, Hybrid GGA, and Meta GGA. Each functional card shows its name, exact exchange percentage, and a help icon.

GGA	Hybrid & Meta GGA	Hybrid GGA	Meta GGA
PBE Pure (0%)	M06 Exact Exchange: 27%	B3LYP Exact Exchange: 20%	M06-L Pure (0%)
BLYP Pure (0%)	M06-2X Exact Exchange: 54%	B3LYP/G Exact Exchange: 20%	TPSS Pure (0%)
BP86 Pure (0%)	PW6B95 Exact Exchange: 28%	PBE0 Exact Exchange: 25%	revTPSS Pure (0%)
OLYP Pure (0%)	TPSSH Exact Exchange: 10%	BHLYP Exact Exchange: 50%	
		O3LYP Exact Exchange: 11.6%	
		B3PW Exact Exchange: 20%	

Searchable functional library: Browse popular functionals or group them by family or developer, with useful method information shown directly in the selector.

Flexible basis assignment: Select a main basis set and apply split basis sets to specific atoms or elements for tailored computational protocols.

FEATURE 03

Run ORCA Locally or Use Machine Profiles

Detect a local ORCA installation, configure computational resources, submit calculations directly, or preserve reusable machine settings for scripted HPC workflows.

The screenshot displays the AutoChemY interface with the 'Input & Script Generator' tab selected. The 'Script' sub-tab is active, showing a job script for a TightSCF calculation. The 'Local ORCA Runtime Status' section indicates that ORCA 6.1.1 is installed and ready, with 12 logical cores detected. The 'Geometry (XYZ format)' section shows the molecular structure and its coordinates. The 'Structure visualization' section displays a 3D ball-and-stick model of the molecule.

Run on your computer: AutoChemY displays the detected ORCA version, available cores, RAM context, and recommended local settings before submission.

Scale to HPC: Saved machine profiles and generated job scripts make repeated cluster submissions more consistent and easier to reproduce.

FEATURE 04

Fast xTB Pre-Screening

Run a quick Lates g-xtb/GFN2-xTB preview before full DFT, inspect the live calculation log, and view a relaxed scan as both numerical energies and a graph.

AutoChemistry

Projects

XTB output folder: C:\Users\Admin\Desktop\Autochemistry-main\Autochemistry-main\external_modules\xtb\xtb_runs\xtb_run_8c8kixym
(res.out / xtb_full.log = full stdout; xtbopt.log = opt steps; xtbscan.log = scan; Chemcraft opens trajectory logs when available)

Save xTB files... Clear xTB Open xTB file... Open xTB Folder History Open xTB output external

Early insight: Rapid scans help identify useful geometries, trends, and problematic regions before a more expensive calculation.

Direct reuse: The resulting xTB geometry can be transferred back into the main ORCA input workflow.

FEATURE 05

Reaction-Pathway Workspace

Collect intermediates and transition states in a unified energy table, then arrange them as an editable reaction-flow diagram.

Data in context: Electronic, thermal, enthalpy, Gibbs, and spin-related values remain connected to each species.

Mechanistic organization: Branches and competing pathways can be assembled visually before producing the final PES figure.

FEATURE 06

Detachable Reaction-Flow Canvas

Open the pathway diagram in a large independent window to inspect complex catalytic networks and compare multiple mechanistic branches.

Large-network visibility: A spacious canvas keeps long and branched pathways readable during analysis.

Interactive editing: Species and connections can be extended, faded, restored, and reorganized as the mechanism develops.

FEATURE 07

Selective Pathway Control

Choose exactly which species or connected pathway should appear in the final PES plot while retaining the complete reaction network in the workspace.

Focused figures: Hide one species, a downstream branch, an upstream branch, or an entire connected pathway.

Non-destructive analysis: Nodes remain available in the reaction-flow diagram, so alternate mechanisms are not lost.

FEATURE 08

Publication-Ready Potential-Energy Plots

Generate a clean potential-energy profile from the selected pathway and refine the figure using built-in styles, labels, colors, grids, and axis controls.

Publication-quality plots for easy comparison of relative Gibbs free energies, enthalpies, and electronic energies of intermediates and transition states.

Scientific communication: Consistent energies and species labels turn calculation data into a figure that is ready for discussion or further polishing.

Rapid iteration: Style and visibility controls make it easy to compare figure treatments without rebuilding the plot manually.

FEATURE 09

CREST Conformational Sampling

Prepare and run CREST sampling, inspect logs and ensemble structures, deduplicate conformers, and create downstream ORCA inputs from selected geometries.

The screenshot displays the AutoChemY xtb & Conformational Analysis interface. The left sidebar contains navigation buttons: Input Creator, Output Viewer, PES Plot, DIA, Orbital Creator, ML, xtb & Conformational Analysis (selected), and About us. The main workspace is titled 'xTB Workspace' and features a 'Conformational Sampling' section. Under 'CREST Conformational Sampling', there are options to load or save XYZ files, set charge and multiplicity, and buttons to run, stop, or open results. A 'Live Log Stream' window is visible. Below, the 'Post-processing' section includes options for deduplicating the pool, splitting the ensemble, and generating ORCA inputs. The 'ORCA input settings' section allows for method, basis, and job selection. A 'Summary' section is at the bottom left. The right side of the interface shows 'Output Geometry / Ensemble Preview' and 'CREST relative energies'.

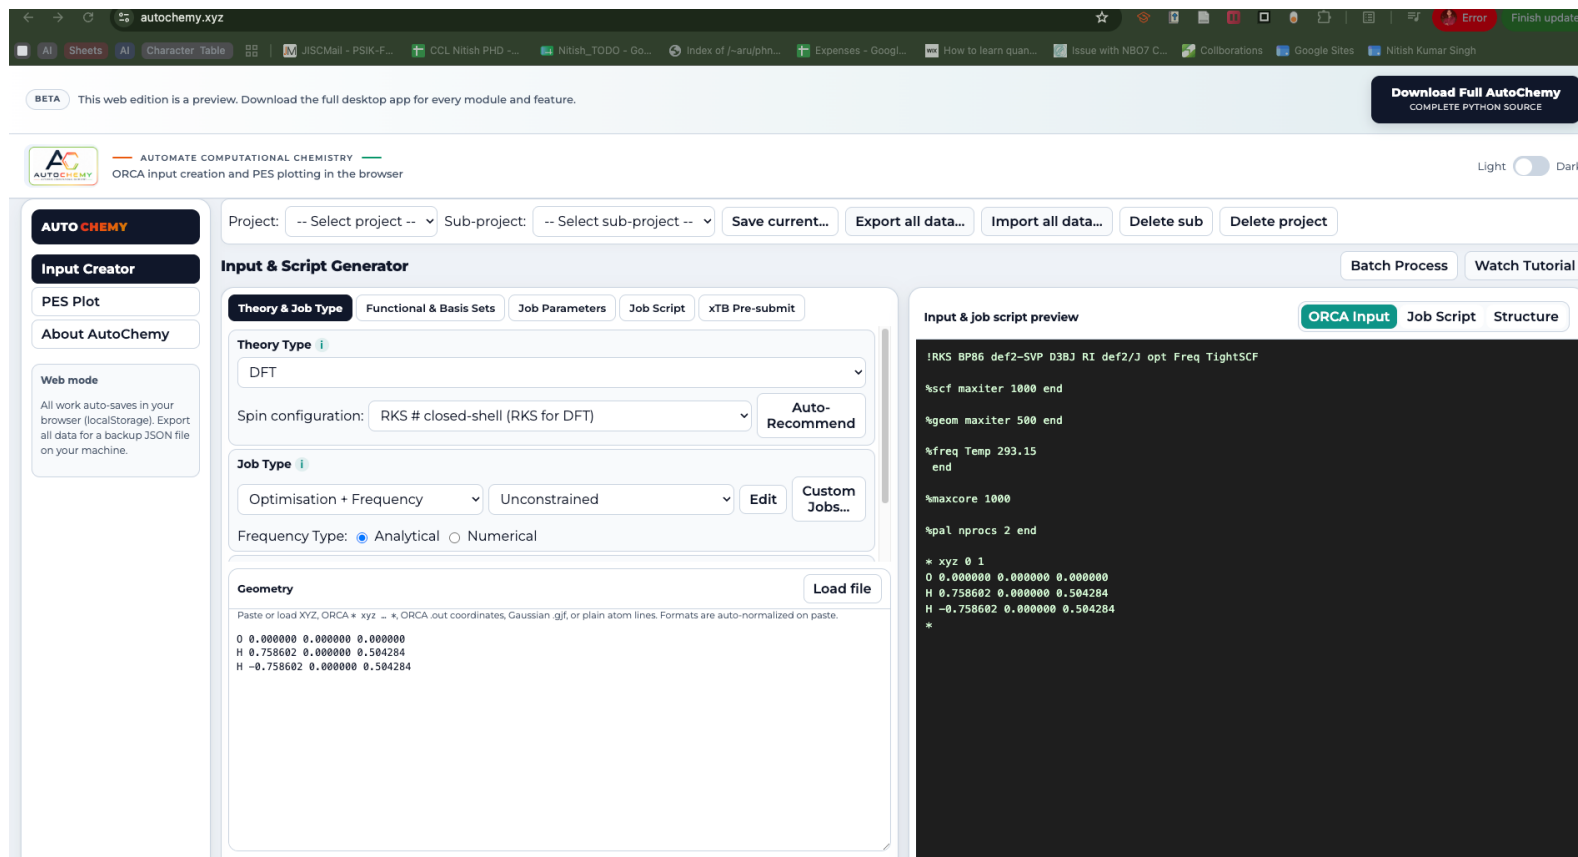

End-to-end sampling: Structure loading, charge and multiplicity, CREST execution, and post-processing are brought together.

Reusable outputs: Export individual XYZ files, conformer-energy summaries, and ORCA-ready inputs for follow-up calculations.

FEATURE 10

Live AutoChemY Web Beta

Open the AutoChemY beta directly at autochemistry.xyz to create ORCA inputs and prepare PES workflows in a browser, with no desktop installation required for the preview modules.

Easy access: The beta is live in the browser, making it convenient to explore AutoChemY, prepare inputs, and demonstrate the interface from any suitable computer.

Browser-safe workflow: Projects auto-save locally in the browser and can be exported or imported as backup data; the complete desktop source remains available for all modules and features.

OPEN THE LIVE BETA autochemistry.xyz

FEATURE 11

Open-Source and Researcher-Led

AutoChemistry is developed by researchers to reduce repetitive quantum-chemistry work and help users spend more time on scientific interpretation.

Motivated by Science

Built by young researchers to support the scientific community, allowing you to save time and focus on what matters most: new ideas and science.

Never Settle for Less

We are committed to ensuring you never have to compromise on quality or features.

Feedback & Support

We are researchers and learning developers doing our best to improve AutoChemistry. If you find bugs, scientific inaccuracies, or unexpected results, please report them so we can fix them for everyone.

[Report Bug / Request Feature](#)

Share

AutoChemistry is free and open-source. We would be thrilled to see it used in workshops to teach computational chemistry, or to help researchers save valuable time. Please share it with others so they can benefit from it as well!

Community use: The software is free to share for research, teaching, workshops, and computational-chemistry training.

Feedback loop: Users can report issues or request features, supporting continuous improvement of the scientific workflow.
